March 20, 1952

Dear Dr. Boulgakov:

I have recently been given to understand that I could reach you at the Pasteur Institute, and hope this letter arrives in good form.

I am writing to inquire about the flagellar phages that were described in 1936 by Sertic and yourself. We are conducting some investigations on the genetics of the flagellar antigens in *Salmonella* for which such phages would be most useful. Unfortunately, I have not been able to obtain any further information about them except for the article by Rakieta and Bornstein. I have consulted Dr. Rakieta in New York, and he regrets that his cultures have been lost.

Would you be kind enough to tell me about the current status of your phages? If your cultures are no longer viable, can you advise me as to the best procedure for isolating this type of phage? If your 1936 preparations are still recoverable, would it be too much to ask to have them sent to us?

We should be most appreciative of these favors, as well as of your reply to this letter.

Yours sincerely,

Joshua Lederberg
Associate Professor of Genetics
